XX PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

XX PT proteins - in presence of disulphide bond cleavage agent, to

XX PT produce proteins suitable for direct use in vaccines or diagnostic

XX PT assays of HCV

XX PS Claim 29; Page 67; 146pp; English.

XX CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

XX CC virus (HCV) E1 and E2 peptides used in competition studies. This

XX CC sequence represents a synthetic E2 peptide, and corresponds to residues

XX CC 397-416 of the E2 protein sequence. These sequences are useful for in

XX CC vitro monitoring of HCV disease, or prognosis of the response to

XX CC interferon treatment of patients suffering from HCV infection. These

XX CC sequences compete with the proteins produced by AAT12704-T12709 and

XX CC AAT12961-T12974, which are included in vectors for the production of

XX CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

XX CC isolated and purified by carrying out a disulphide bond cleavage, or a

XX CC reduction step with a disulphide bond cleavage agent, after lysis of

XX CC recombinant host cells. The constructs containing the purified HCV

XX CC envelope proteins can be used for vaccinating humans against HCV, for in

XX CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

XX CC for detecting one or more serological types of HCV present in a

XX CC biological sample. The constructs can also be immobilised on a solid

XX CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX PT New therapeutic vaccine compositions comprising at least one purified

XX PT recombinant hepatitis C virus (HCV) single or specific oligomeric

XX PT recombinant envelope protein E1 or E2, useful for immunizing humans

XX PT from HCV infection

XX PS Claim 4; Page 225; 243pp; English.

XX CC The present invention relates to new therapeutic vaccine compositions for

XX CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

XX CC composition containing at least one purified recombinant HCV single or

XX CC specific oligomeric recombinant envelope proteins selected from an E1 and

XX CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

XX CC useful for inducing HCV-specific antibodies or for immunising humans

XX CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

XX CC vaccines or therapeutics, in HCV screening and confirmatory antibody

XX CC tests, for raising antibodies, in the preparation of medicament, and for

XX CC in vitro monitoring of HCV disease or prognosing the response to

XX CC treatment of patients suffering from HCV infection. The present sequence

XX CC is a peptide derived from the proteins of the invention.

XX New anti-Hepatitis C virus (HCV) antibodies useful for in situ
 PT detection of HCV -

XX Example 4; Page 9; 32pp; English.

XX This sequence represents residues 394-416 of the hepatitis c virus (HCV)
 CC E2 protein. The invention relates to an antibody (Ab) or its derivative
 CC that specifically binds to the C-terminal region of the HCV E1 protein
 CC (amino acids (aa) 227-383) or the N-terminal region of the HCV E2 protein
 CC (aa 384-450). The Ab allows the in situ detection of HCV protein
 CC antigens. The Ab is used to detect the HCV E1 or E2 proteins in human
 CC peripheral blood cells or liver tissue. It may also be used to detect HCV
 CC in other tissue and fluid samples such as serum, plasma, saliva, mucus
 CC and sections or biopsies such as from skin.

 PT Immuno-reactive hepatitis C virus polypeptide compns. - contg.
 PT at least 2 sequences from the first variable domain of distinct
 PT HCV isolates

PS Disclosure; Fig 3; 106pp; English.

XX
 CC The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAQ39134-48
 CC and AAR33982-91.

 PS Claim 2; Pages 40-41; 58pp; English.
 XX
 CC Glycoprotein E2/NS1 is derived from the second envelope protein or
 CC first non-structural protein encoded by the genome of HCV. The
 CC nucleic acid is extracted from the serum of the patient of hepatitis
 CC C. The serum is pref. mixed with transfer RNA (tRNA) as a carrier
 CC of virus RNA. As a technique of cloning cDNA from the nucleic acid,
 CC it is preferred to use polymerase chain reaction method. In the
 CC reaction, any commercially available random primers or synthesized
 CC DNA having a base sequence similar to that of primer AS1 may be used
 CC as a primer. Representative examples of sense primers include S1.

 PS
 XX This sequence is the gene product from the genome of the non-A, non-B
 CC hepatitis virus (NANBH) strain HC-J1. This sequence was derived
 CC from the DNA sequence which was amplified by polymerase chain reaction.

CC The nucleotide sequences derived from this amplification can be used to
 CC detect NANBH virus infection which could not be detected by conventional
 CC methods. The detection kits allow highly specific and sensitive
 CC detection at an early phase of infection. This polypeptide sequence
 CC can be used for the manufacture of vaccines and immunological
 CC pharmaceuticals and also to produce antibodies specific to NANBH.

PT New peptides acting as antigenic analogues of human hepatitis C
 PT virus - useful for detecting HCV antibody positive patients

PS Disclosure; Fig 2; 14pp; Japanese.

XX The sequences given in AAR25135-36 are peptides from the hepatitis C
 CC virus (HCV) which are recognised by the peptide sequences given in
 CC AAR25130-24. These antigenic peptides can be used on their own or as
 CC a mixture two different peptides. Using these peptides, HCV antibody
 CC positive patients can be detected and hepatitis caused by blood
 CC transfusion can be prevented.

XX New synthetic peptides for detecting antibodies to hepatitis C
 FT virus - useful in e.g. ELISA assays, and for detection of HCV
 FT antigens or as immunogens

XX Disclosure; Fig 1; 32pp; English.

CC RNA viruses frequently exhibit a high rate of spontaneous mutation,
 CC thus a virus is considered to be the same of equiv. to HCV if it
 CC exhibits a global homology of more than 70 percent with the HCV HC-
 CC J1/CDC/CHI composite sequence. The peptide fragments of this DNA
 CC sequence indicated in the features table can immunologically mimic
 CC proteins encoded by HCV. Additional amino acids or chemical gps.
 CC may be added to either end of the peptides for the purpose of
 CC creating a linker arm for attachment to a carrier. The peptides can
 CC be used for the detection of antibodies specific for HCV. They may
 CC be used in the form of kits, opt. with reagents such as
 CC staphylococcal protein A, streptococcal protein G, avidin or
 CC streptavidin. The peptides may also be used as immunogens for
 CC raising antibodies.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
CC ACTIVATION OF NS3.
CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC {RNA} (N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1

CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
 CC -1- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
 CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES
 CC -1- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
 CC -1- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

PT recombinant envelope protein E1 or E2, useful for immunizing humans
 PT from HCV infection
 XX
 PS Claim 4; Page 226; 243pp; English.
 XX
 CC The present invention relates to new therapeutic vaccine compositions for
 CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a
 CC composition containing at least one purified recombinant HCV single or
 CC specific oligomeric recombinant envelope proteins selected from an E1 and
 CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are
 CC useful for inducing HCV-specific antibodies or for immunising humans
 CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as
 CC vaccines or therapeutics, in HCV screening and confirmatory antibody
 CC tests, for raising antibodies, in the preparation of medicament, and for
 CC in vitro monitoring of HCV disease or prognosing the response to
 CC treatment of patients suffering from HCV infection. The present sequence
 CC is a peptide derived from the proteins of the invention.

 PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope
 PT proteins - in presence of disulphide bond cleavage agent, to
 PT produce proteins suitable for direct use in vaccines or diagnostic
 PT assays of HCV

XX
 PS Claim 29; Page 67; 146pp; English.

XX
 CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C
 CC virus (HCV) E1 and E2 peptides used in competition studies. This
 CC sequence represents a synthetic E2 peptide, and corresponds to residues
 CC 409-428 of the E2 protein sequence. These sequences are useful for in
 CC vitro monitoring of HCV disease, or prognosis of the response to
 CC interferon treatment of patients suffering from HCV infection. These
 CC sequences compete with the proteins produced by AAT12704-T12709 and
 CC AAT12961-T12974, which are included in vectors for the production of
 CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be
 CC isolated and purified by carrying out a disulphide bond cleavage, or a
 CC reduction step with a disulphide bond cleavage agent, after lysis of
 CC recombinant host cells. The constructs containing the purified HCV
 CC envelope proteins can be used for vaccinating humans against HCV, for in
 CC vitro detection of HCV antibodies in a sample, and in a serotyping assay
 CC for detecting one or more serological types of HCV present in a
 CC biological sample. The constructs can also be immobilised on a solid
 CC substrate and incorporated into a reversed phase hybridisation assay for
 CC determining the presence or the genotype of HCV. The new purification
 CC method preserves the conformation of the recombinantly expressed E1, E2
 CC and E1/E2, and eliminates contaminating proteins. Antigens isolated
 CC using this method are more reactive with human sera than those isolated
 CC by known techniques.

XX New synthetic polypeptides having several different segments of at
 PT least one parent polypeptide linked together differently compared to
 PT the linkage in the parent polypeptide, for inducing immune response
 PT against a pathogen or cancer -

XX Example 2; Fig 26; 364pp; English.

XX The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an
 CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for
 CC designing the synthetic polypeptides. The synthetic polypeptides and
 CC polynucleotides are referred to as a savine. The synthetic polypeptide is
 CC useful for modulating immune responses preferably directed against a
 CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
 CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
 CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present
 CC sequence is a peptide derived from a parent protein used to
 CC construct a savine of the invention.

XX PT New selected interacting domain polypeptides and polynucleotides,
XX PT useful for treating or preventing infections or pathologies caused by
XX PT hepatitis C virus (HCV) or those linked to HCV infection

XX PS Claim 26; SEQ ID 80; 61pp + sequence listing; English.

XX CC The invention relates to nucleic acids encoding polypeptides which are
XX CC termed SID polypeptides (selected interacting domain). These polypeptides
XX CC are the final products of a double selection method involving a first
XX CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
XX CC through a two-hybrid system, and a second selection step involving an
XX CC alignment between the different polynucleotides selected at the first
XX CC step. The activity of polypeptides of the invention may be described as,
XX CC virucide, hepatotropic, antiinflammatory and antibacterial. The
XX CC polypeptide, polynucleotide and compositions comprising them are useful
XX CC for treating or preventing viral or a bacterial infection, specifically
XX CC infections or pathologies caused by HCV, or those pathologies linked to
XX CC HCV infection. These may include liver disease and liver cancer. The
XX CC current sequence represents a HCV bait polypeptide.

XX CC Note: The sequence data for this patent is not represented in the
XX CC specification, but is based on sequence information supplied by the
XX CC European Patent Office.

 XX PT Immuno-reactive hepatitis C virus polypeptide compsns. - contg.
 PT at least 2 sequences from the first variable domain of distinct
 PT HCV isolates
 XX PS Disclosure; Fig 3; 106pp; English.
 XX CC The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAO39134-48
 CC and AAR33982-91.

XX PT Diagnostic reagent for hepatitis C virus - comprises second
XX PT envelope protein or first non-structural protein encoded by HCV
XX PT gene and has sugar chain
XX PS Claim 2; Pages 40-41; 58pp; English.
XX CC Glycoprotein E2/NS1 is derived from the second envelope protein or
XX CC first non-structural protein encoded by the genome of HCV. The
XX CC nucleic acid is extracted from the serum of the patient of hepatitis
XX CC C. The serum is pref. mixed with transfer RNA (tRNA) as a carrier
XX CC of virus RNA. As a technique of cloning cDNA from the nucleic acid,
XX CC it is preferred to use polymerase chain reaction method. In the
XX CC reaction, any commercially available random primers or synthesized
XX CC DNA having a base sequence similar to that of primer AS1 may be used
XX CC as a primer. Representative examples of sense primers include S1.

XX  New plasmid pHCV-162 is a mammalian expression systems for HCV
PT  proteins - useful for diagnosing HCV infection and as vaccines
PT  for preventing HCV infection
XX
XX  Claim 10; Page 81-82; 100pp; English.
XX
XX  A sequence coding for the HCV E2 protein (amino acids 384-684 from
CC  HCV-infected chimpanzee CO isolate, see AAR40119) was generated using
CC  PCR. An EcoRI site was used to attach a synthetic oligonucleotide
CC  encoding the Human Growth Hormone secretion signal at the 5'-end of
CC  the HCV sequence. The resultant plasmid was designated pHCV-170.
CC  AAR40118 is the sequence of the HGH-HCV-E2 fusion protein expressed
CC  by vector pHCV-170. See AAR47192-Q47196.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RL CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.

CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.

CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE ACTIVATION OF NS3.

CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.

CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA} (N).

CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPID PROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.

CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.

CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

XX Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

PT proteins - in presence of disulphide bond cleavage agent, to

PT produce proteins suitable for direct use in vaccines or diagnostic

PT assays of HCV

XX Example 7; Page 67; 146pp; English.

XX AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

CC virus (HCV) E1 and E2 peptides used in competition studies. This

CC sequence represents a synthetic E2 peptide, and corresponds to residues

CC 427-446 of the E2 protein sequence. These sequences are useful for in

CC vitro monitoring of HCV disease, or prognosis of the response to

CC interferon treatment of patients suffering from HCV infection. These

CC sequences compete with the proteins produced by AAT12704-T12709 and

CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

CC isolated and purified by carrying out a disulphide bond cleavage, or a

CC reduction step with a disulphide bond cleavage agent, after lysis of

CC recombinant host cells. The constructs containing the purified HCV

CC envelope proteins can be used for vaccinating humans against HCV, for in

CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

CC for detecting one or more serological types of HCV present in a

CC biological sample. The constructs can also be immobilised on a solid

CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX New therapeutic vaccine compositions comprising at least one purified

PT recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans

PT from HCV infection

XX Example 7; Page 226; 243pp; English.

XX The present invention relates to new therapeutic vaccine compositions for

CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

CC composition containing at least one purified recombinant HCV single or

CC specific oligomeric recombinant envelope proteins selected from an E1 and

CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

CC useful for inducing HCV-specific antibodies or for immunising humans

CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

CC vaccines or therapeutics, in HCV screening and confirmatory antibody

CC tests for raising antibodies, in the preparation of medicament, and for

CC in vitro monitoring of HCV disease or prognosing the response to

CC treatment of patients suffering from HCV infection. The present sequence

CC is a peptide derived from the proteins of the invention.

XX PT against a pathogen or cancer
XX PS Example 2; Fig 26; 364pp; English.

XX CC The invention relates to a new synthetic polypeptide (I) comprising
XX CC several different segments of at least one parent polypeptide linked
XX CC together in a different relationship relative to their linkage in the
XX CC parent polypeptide to impede, abrogate or otherwise alter at least one
XX CC function associated with the parent polypeptide and for inducing an
XX CC immune response against a pathogen or cancer. Also included are a
XX CC synthetic polynucleotide encoding and a computer system for
XX CC designing the synthetic polypeptides. The synthetic polypeptide is
XX CC polynucleotides are referred to as a Savine. The synthetic polypeptide is
XX CC useful for modulating immune responses preferably directed against a
XX CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
XX CC colon, head and neck, pancreas, prostate, stomach, kidney, bone
XX CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
XX CC Compositions comprising the polypeptide may be used in the treatment or
XX CC prophylaxis against viral (such as infections caused by HIV (human
XX CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
XX CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
XX CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
XX CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
XX CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
XX CC Trypanosoma, Toxoplasma and Giardia) infections. The present
XX CC sequence is a peptide derived from a parent protein used to
XX CC construct a savine of the invention.

XX New selected interacting domain polypeptides and polynucleotides,
 PT useful for treating or preventing infections or pathologies caused by
 PT hepatitis C virus (HCV) or those linked to HCV infection -
 XX Claim 26; SEQ ID 80; 61pp + sequence listing; English.
 XX The invention relates to nucleic acids encoding polypeptides which are
 CC termed SID polypeptides (selected interacting domain). These polypeptides
 CC are the final products of a double selection method involving a first
 CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
 CC through a two-hybrid system, and a second selection step involving an
 CC alignment between the different polynucleotides selected at the first
 CC step. The activity of polypeptides of the invention may be described as,
 CC virucide, hepatotropic, antiinflammatory and antibacterial. The
 CC polypeptide, polynucleotide and compositions comprising them are useful
 CC for treating or preventing viral or a bacterial infection, specifically
 CC infections or pathologies caused by HCV, or those pathologies linked to
 CC HCV infection. These may include liver disease and liver cancer. The
 CC current sequence represents a HCV bait polypeptide.
 CC Note: The sequence data for this patent is not represented in the
 CC specification, but is based on sequence information supplied by the
 CC European Patent Office.

 PT at least 2 sequences from the first variable domain of distinct
 PT HCV isolates
 XX Disclosure; Fig 3; 106pp; English.
 XX

CC The sequences given in AAR3392-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAQ39134-48
 CC and AAR3392-91.

 XX
 PT New immunogenic polypeptide comprising hepatitis C virus E2 polypeptide
 PT useful for treating hepatitis C virus infection and for providing
 PT immune protection against virus infection -
 XX
 PS Claim 4; Fig 6; 84pp; English.
 XX
 CC The invention relates to a secreted polypeptide comprising hepatitis C
 CC virus (HCV) E2 polypeptide lacking all or a portion of its membrane
 CC spanning domain so that the E2 polypeptide is capable of secretion into
 CC growth medium when expressed recombinantly in a host cell. The
 CC polypeptide may also lack a portion of its C-terminus. The HCV E2
 CC secreted polypeptide is useful for producing anti-HCV antibodies. A
 CC purified immunogenic polypeptide comprising HCV E2 is useful for treating
 CC HCV infection and for providing immune protection against HCV infection
 CC by administering it to a subject having or at risk of having HCV
 CC infection or in need of protection. The method further comprises
 CC administering an immunomodulatory agent such as interleukin-2 (IL-2),
 CC granulocyte macrophage-colony stimulating factor (GM-CSF) or
 CC gamma-interferon. The polypeptide is useful as a vaccine, and with other
 CC HCV proteins to form a multi-component HCV vaccine for prophylactic or
 CC therapeutic treatment of HCV infection. This sequence represents an N-
 CC and C-terminally truncated HCV delta-delta E2 genotype 1a protein.

PS
XX The present sequence is hepatitis C virus (HCV) E2-634 HVR1 construct
CC containing the endoplasmic reticulum signal sequence of envelope protein
CC E1 and carboxy-terminal truncated E2 protein lacking the hypervariable
CC region one (HVR1). The HCV E2 protein lacking HVR1 DNA is useful for
CC producing infectious HCV and chimeric HCV viruses which are useful
CC for identifying cell lines capable of supporting the replication of
CC viruses. The infectious HCV and HVR1-chimeric HCV are used in the
CC production of attenuated or inactivated vaccines which are useful for
CC treating or preventing HCV in a mammal by immunisation. The host cells
CC expressing the H77C(HVR1) DNA is useful as an immunogen to stimulate a
CC protective immune response to HCV. The immunogens are useful for
CC producing protective antibodies to HCV. The antibodies produced are used
CC in passive immunoprophylaxis for treatment of diseases caused by HCV in
CC animals, especially humans. The H77C(HVR1) DNA is also useful in gene
CC therapy.

XX PS

CC This sequence comprises the conceptual translation product of

CC a hepatitis C virus E2 antigen expression cassette (AAT13899). The

CC encoded E2 antigen is truncated at amino acid residue 644 of HCV,

CC and contains an N-terminal sequence (SNEI) from human prourokinase

CC intended to promote signal processing, efficient secretion

CC and final product stability. Glycosylated E2 can be expressed in

CC mammalian host cells utilizing claimed plasmid 577. Fusion

CC proteins produced by plasmid 577 are used in claimed assays and

CC test kits for detecting anti-analyte antibody as well as in claimed

CC vaccines for treatment of infection. The plasmid can be used to

CC produce high levels of proteins that would not normally be
CC expressed in mammalian cells due to the non-secretory nature of the
CC gene. The system is esp. used for expressing HCV proteins, allowing
CC proper processing, glycosylation and conformation of the viral
CC protein.

CC -!- FUNCTION: THERMOSTABLE EXTRACELLULAR ZINC METALLOPROTEASE.
CC -!- CATALYTIC ACTIVITY: Preferential cleavage: Xaa-[Leu > Xaa]-Phe.
CC -!- COFACTOR: BINDS 1 ZINC ION AND FOUR CALCIUM IONS WHICH
CC CONTRIBUTE TO THE UNUSUAL THERMAL STABILITY OF THIS ENDOPEPTIDASE.
CC TWO ARE CLOSE TOGETHER AND PARTICIPATE IN A NETWORK OF SALT LINKS
CC ALSO INVOLVING ASP-138, GLU-177, LYS-182, ASP-185, GLU-190, AND
CC ASP-191. A THIRD INTERACTS WITH ASP-57 AND A FOURTH WITH ASP-200.
CC GLU AT POSITION 302 APPEARS TO FORM A SALT LINK WITH LYS-262.
CC -!- SUBCELLULAR LOCATION: Secreted.
CC -!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M4.

DR Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

PT proteins - in presence of disulphide bond cleavage agent, to

PT produce proteins suitable for direct use in vaccines or diagnostic

PT assays of HCV

XX Example 7; Page 67; 146pp; English.

XX AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

CC virus (HCV) E1 and E2 peptides used in competition studies. This

CC sequence represents a synthetic E2 peptide, and corresponds to residues

CC 439-458 of the E2 protein sequence. These sequences are useful for in

CC viro monitoring of HCV disease, or prognosis of the response to

CC interferon treatment of patients suffering from HCV infection. These

CC sequences compete with the proteins produced by AAT12704-T12709 and

CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

CC isolated and purified by carrying out a disulphide bond cleavage, or a

CC reduction step with a disulphide bond cleavage agent, after lysis of

CC recombinant host cells. The constructs containing the purified HCV

CC envelope proteins can be used for vaccinating humans against HCV, for in

CC viro detection of HCV antibodies in a sample, and in a serotyping assay

CC for detecting one or more serological types of HCV present in a

CC biological sample. The constructs can also be immobilised on a solid

CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX New therapeutic vaccine compositions comprising at least one purified

PT recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans

PT from HCV infection

XX Example 7; Page 226; 243pp; English.

XX The present invention relates to new therapeutic vaccine compositions for

CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

CC composition containing at least one purified recombinant HCV single or

CC specific oligomeric recombinant envelope proteins selected from an E1 and

CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

CC useful for inducing HCV-specific antibodies or for immunising humans

CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

CC vaccines or therapeutics, in HCV screening and confirmatory antibody

CC tests, for raising antibodies, in the preparation of medicament, and for

CC in vitro monitoring of HCV disease or prognosing the response to

CC treatment of patients suffering from HCV infection. The present sequence

CC is a peptide derived from the proteins of the invention.

PT Immuno-reactive hepatitis C virus polypeptide compens. - contg.
PT at least 2 sequences from the first variable domain of distinct
PT HCV isolates
XX Disclosure; Fig 3; 106pp; English.

The sequences given in AAR33992-002 represent a portion of the E2/NS1 protein encoded by group I and group II HCV isolates, from amino acid 370-850. E2/NS1 are viral envelope proteins and are of immunogenic interest. E2/NS1 contains an N-terminal hypervariable domain of about 30 amino acids which shows large variation between nearly all isolates. This is an important immunoreactive domain. This putative envelope glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera virus) envelope polypeptide of the pestiviruses and the NS1 of the flaviviruses, both of which confer protective immunity in hosts vaccinated with these polypeptides. It has been discovered that a number of important HCV epitopes vary among viral isolates and that these epitopes can be mapped to specific domains. This meant that immunologically cross-reactive polypeptides which focus on variable rather than constant domains can be produced. See also AAQ39134-48 and AAR33982-91.

XX Diagnostic reagent for hepatitis C virus - comprises second
PT envelope protein or first non-structural protein encoded by HCV
PT gene and has sugar chain
XX Claim 2; Pages 40-41; 58pp; English.

Glycoprotein E2/NS1 is derived from the second envelope protein or first non-structural protein encoded by the genome of HCV. The nucleic acid is extracted from the serum of the patient of hepatitis C. The serum is pref. mixed with transfer RNA (tRNA) as a carrier of virus RNA. As a technique of cloning cDNA from the nucleic acid, it is preferred to use polymerase chain reaction method. In the reaction, any commercially available random primers or synthesized DNA having a base sequence similar to that of primer AS1 may be used as a primer. Representative examples of sense primers include S1.

 PT peptides - useful for diagnosis and in vaccines and immunological
 PT pharmaceuticals
 XX Disclosure; Page 19; 42pp; English.

CC This sequence is the gene product from the genome of the non-A, non-B
 CC hepatitis virus (NANBH) strain HC-J1. This sequence was derived
 CC from the DNA sequence which was amplified by polymerase chain reaction.
 CC The nucleotide sequences derived from this amplification can be used to
 CC detect NANBH infection which could not be detected by conventional
 CC methods. The detection kits allow highly specific and sensitive
 CC detection at an early phase of infection. This polypeptide sequence
 CC can be used for the manufacture of vaccines and immunological
 CC pharmaceuticals and also to produce antibodies specific to NANBH.

XX FT virus - useful in e.g. ELISA assays, and for detection of HCV
XX FT antigens or as immunogens
XX XX
XX PS Disclosure; Fig 1; 32pp; English.
XX XX
XX CC RNA viruses frequently exhibit a high rate of spontaneous mutation,
XX CC thus a virus is considered to be the same of equiv. to HCV if it
XX CC exhibits a global homology of more than 70 percent with the HCV HC-
XX CC J1/CDC/CHI composite sequence. The peptide fragments of this DNA
XX CC sequence indicated in the features table can immunologically mimic
XX CC proteins encoded by HCV. Additional amino acids or chemical gps.
XX CC may be added to either end of the peptides for the purpose of
XX CC creating a linker arm for attachment to a carrier. The peptides can
XX CC be used for the detection of antibodies specific for HCV. They may
XX CC be used in the form of kits, opt. with reagents such as
XX CC staphylococcal protein A, streptococcal protein G, avidin or
XX CC streptavidin. The peptides may also be used as immunogens for
XX CC raising antibodies.

XX New synthetic polypeptides having several different segments of at
 PT least one parent polypeptide linked together differently compared to
 PT the linkage in the parent polypeptide, for inducing immune response
 PT against a pathogen or cancer -

XX Example 2; Fig 26; 364pp; English.

XX The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an
 CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for
 CC designing the synthetic polypeptides. The synthetic polypeptides and
 CC polynucleotides are referred to as a savine. The synthetic polypeptide is
 CC useful for modulating immune responses preferably directed against a
 CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
 CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
 CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis

CC virus, Epstein-Barr virus and respiratory syncytial virus); bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present
 CC sequence is a peptide derived from a parent protein used to
 CC construct a savine of the invention.

XX New selected interacting domain polypeptides and polynucleotides,
 PT useful for treating or preventing infections or pathologies caused by
 PT hepatitis C virus (HCV) or those linked to HCV infection -

XX Claim 26; SEQ ID 80; 61pp + sequence listing; English.

XX The invention relates to nucleic acids encoding polypeptides which are
 CC termed SID polypeptides (selected interacting domain). These polypeptides
 CC are the final products of a double selection method involving a first
 CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
 CC through a two-hybrid system, and a second selection step involving an
 CC alignment between the different polynucleotides selected at the first
 CC step. The activity of polypeptides of the invention may be described as,
 CC virucide, hepatotropic, antiinflammatory and antibacterial. The
 CC polypeptide, polynucleotide and compositions comprising them are useful
 CC for treating or preventing viral or a bacterial infection, specifically
 CC infections or pathologies caused by HCV, or those pathologies linked to
 CC HCV infection. These may include liver disease and liver cancer. The
 CC current sequence represents a HCV bait polypeptide.

XX Note: The sequence data for this patent is not represented in the
 CC specification, but is based on sequence information supplied by the
 CC European Patent Office.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE ACTIVATION OF NS3.
CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position. Cys or Thr in Pi and Ser or Ala in P1.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA} (N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1

CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
 CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
 CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
 CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
 CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

CC -!- TISSUE SPECIFICITY: Expressed ubiquitously at low levels. High
CC levels of expression are confined to hematopoietic tissues
CC including peripheral blood leukocytes, thymus and spleen.
CC -!- DEVELOPMENTAL STAGE: Expressed from early embryogenesis through to
CC adulthood.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope proteins - in presence of disulphide bond cleavage agent, to produce proteins suitable for direct use in vaccines or diagnostic assays of HCV

Example 7; Page 67; 146pp; English.

CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C virus (HCV) E1 and E2 peptides used in competition studies. This sequence represents a synthetic E2 peptide, and corresponds to residues 451-470 of the E2 protein sequence. These sequences are useful for in vitro monitoring of HCV disease, or prognosis of the response to interferon treatment of patients suffering from HCV infection. These sequences compete with the proteins produced by AAT12704-T12709 and AAT12961-T12974, which are included in vectors for the production of recombinant E1, E2, and E1/E2. The recombinant proteins can then be isolated and purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage agent, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known techniques.

PT New therapeutic vaccine compositions comprising at least one purified recombinant hepatitis C virus (HCV) single or specific oligomeric recombinant envelope protein E1 or E2, useful for immunizing humans from HCV infection

Example 7; Page 226-227; 243pp; English.

CC The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV) -specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an E1 and an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV E1 and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosis of the response to treatment of patients suffering from HCV infection. The present sequence is a peptide derived from the proteins of the invention.

XX Novel composition comprising a hepatitis C virus antisense polynucleotide which is complementary to or corresponds to a sense strand of the virus genome, and selectively hybridises to it -

Example; Fig 4; 75pp; English.

The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense polynucleotide. The HCV is characterized by a positive stranded RNA genome which has 40% homology at the polypeptide level to a HCV polypotein. The antisense polynucleotide binds to cellular polynucleotides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the course of the invention.

XX

CC The present sequence represents a water soluble variant of a Hepatitis C virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein (such as the human Eo protein), and so inhibit the attachment of HCV onto cells (especially liver cells), are used to treat HCV infections in mammals, in particular humans. The specification also describes a method for identifying a compound which can be used for treating or preventing HCV in a subject and which can inhibit the attachment of HCV onto cells by inhibiting the binding of HCV envelope E2 protein to a cellular protein associated with HCV attachment and entry into cells. The method comprises incubating the compound, HCV envelope E2 protein or its variant

CC and a cellular^o protein capable of specifically binding to the HCV E2
CC protein under suitable reaction conditions; determining the interactions
CC between HCV envelope E2 protein and cellular protein in the presence and
CC absence of the compound; and comparing the interaction to identify a
CC compound which can inhibit the attachment of HCV onto cells.

Immuo-reactive hepatitis C virus polypeptide compsns. - contg.
at least 2 sequences from the first variable domain of distinct
HCV isolates

XX PS Disclosure: Fig 3: 106pp; English.

The sequences given in AAR33992-002 represent a portion of the E2/NS1 protein encoded by group I and group II HCV isolates, from amino acid 370-850. E2/NS1 are viral envelope proteins and are of immunogenic interest. E2/NS1 contains an N-terminal hypervariable domain of about 30 amino acids which shows large variation between nearly all isolates. This is an important immunoreactive domain. This putative envelope glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera virus) envelope polypeptide of the pestiviruses and the NS1 of the flaviviruses, both of which confer protective immunity in hosts vaccinated with these polypeptides. It has been discovered that a number of important HCV epitopes vary among viral isolates and that these epitopes can be mapped to specific domains. This meant that immunologically cross-reactive polypeptides which focus on variable rather than constant domains can be produced. See also AAQ33134-48 and AAR33982-91.

 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

 XX Hepatitis C assay using recombinant NS1 region antigens - for
 PT detecting antibodies and antigen in body fluids from individuals
 PT exposed to hepatitis C virus
 XX Claim 1; Page 38-40; 175pp; English.
 XX Eight oligonucleotides representing amino acids 365-579 of the HCV
 CC genome were ligated together and cloned as a 645bp EcoRI/BamHI
 CC fragment into the CKS fusion vector pJO200. The amino acid sequence
 CC of this antigen is designated pHCV-77 (i.e. AAR33588). The resultant
 CC fusion protein HCV CKS-NS1S1 consists of 239 amino acids of CKS,
 CC seven amino acids contributed by linker DNA sequences and 215 amino
 CC acids from the NS1 region of the HCV genome. The fusion protein is
 CC used to detect antibodies and antigen in body fluids from
 CC individuals exposed to HCV.

 XX Monoclonal antibodies specific for hepatitis C virus E2-NS1
 PT antigen - useful for diagnosis and evaluation of HCV infections
 PT and in differentiation studies
 XX Example; Pages 36-37; 48pp; English.
 XX Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs
 CC 600-720 were mapped with PEPSKAN analysis. Based on the EIA reactivity
 CC of a panel of HCV positive sera, peptide AAR33184 was chosen as the
 CC immunogen for the generation of monoclonal antibodies to HCV NS1.
 CC Several individual oligos representing AAs 365-731 of HCV genome
 CC were ligated and cloned as three separate EcoRI/BamHI subfragments
 CC into the CKS fusion vector pJO200. The sequences of these three
 CC subfragments - pHCV80, pHCV77 and pHCV65 are in AAR33185-7.
 CC Analysis showed that Mabs H13C113 and H23C163 showed reactivity
 CC pHCV80 and pHCV65.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC	-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.			
CC	NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.			
CC	-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.			
CC	-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA} (N).			
CC	-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND RNA.			
CC	-!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

 CC -1- FUNCTION: THROMBOMODULIN IS A SPECIFIC ENDOTHELIAL CELL RECEPTOR
 THAT FORMS A 1:1 STOICHIOMETRIC COMPLEX WITH THROMBIN. THIS
 COMPLEX IS RESPONSIBLE FOR THE CONVERSION OF PROTEIN C TO THE
 ACTIVATED PROTEIN C (PROTEIN CA). ONCE EVOLVED, PROTEIN CA
 SCISSIONS THE ACTIVATED COFACTORS OF THE COAGULATION MECHANISM,
 FACTOR VA AND FACTOR VIIIa, AND THEREBY REDUCES THE AMOUNT OF
 THROMBIN GENERATED.
 CC -1- SUBCELLULAR LOCATION: Type I membrane protein.
 CC -1- TISSUE SPECIFICITY: ENDOTHELIAL CELLS ARE UNIQUE IN SYNTHESIZING
 THROMBOMODULIN (BY SIMILARITY).
 CC -1- SIMILARITY: Contains 6 EGF-like domains.

 CC -1- SUBCELLULAR LOCATION: Nuclear (Potential).
 CC -1- TISSUE SPECIFICITY: Seems to be expressed at a low level.
 CC -1- DISEASE: Defects in TBX22 are the cause of X-linked cleft palate
 with ankyloglossia (CPX) [MIM:303400].
 CC -1- SIMILARITY: Contains 1 T-box domain.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

PT proteins - in presence of disulphide bond cleavage agent, to

PT produce proteins suitable for direct use in vaccines or diagnostic

PT assays of HCV

XX PS Example 7; Page 67; 146pp; English.

XX CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

CC virus (HCV) E1 and E2 peptides used in competition studies. This

CC sequence represents a synthetic E2 peptide, and corresponds to residues

CC 463-482 of the E2 protein sequence. These sequences are useful for in

CC vitro monitoring of HCV disease, or prognosis of the response to

CC interferon treatment of patients suffering from HCV infection. These

CC sequences compete with the proteins produced by AAT12704-T12709 and

CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

CC isolated and purified by carrying out a disulphide bond cleavage, or a

CC reduction step with a disulphide bond cleavage agent, after lysis of

CC recombinant host cells. The constructs containing the purified HCV

CC envelope proteins can be used for vaccinating humans against HCV, for in

CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

CC for detecting one or more serological types of HCV present in a

CC biological sample. The constructs can also be immobilised on a solid

CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX PT New therapeutic vaccine compositions comprising at least one purified

PT recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans

PT from HCV infection

XX PS Example 7; Page 227; 243pp; English.

XX CC The present invention relates to new therapeutic vaccine compositions for

CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

CC composition containing at least one purified recombinant HCV single or

CC specific oligomeric recombinant envelope proteins selected from an E1 and

CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

CC useful for inducing HCV-specific antibodies or for immunising humans

CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

CC vaccines or therapeutics, in HCV screening and confirmatory antibody

CC tests, for raising antibodies, in the preparation of medicament, and for

CC in vitro monitoring of HCV disease or prognosing the response to

CC treatment of patients suffering from HCV infection. The present sequence

CC is a peptide derived from the proteins of the invention.

XX The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
 CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polypeptide. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

XX Treating or preventing hepatitis C virus infection in a subject,
 PT involves administering hepatitis C virus envelope protein E2 binding
 PT agents -

XX Claim 5; Fig 8; 46pp; English.

XX The present sequence represents a water soluble variant of a Hepatitis C
 CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
 CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
 CC cells (especially liver cells), are used to treat HCV infections in
 CC mammals, in particular humans. The specification also describes a method
 CC for identifying a compound which can be used for treating or preventing
 CC HCV in a subject and which can inhibit the attachment of HCV onto cells
 CC by inhibiting the binding of HCV envelope E2 protein to a cellular
 CC protein associated with HCV attachment and entry into cells. The method
 CC comprises incubating the compound, HCV envelope E2 protein or its variant

CC and a cellular protein capable of specifically binding to the HCV E2
 CC protein under suitable reaction conditions; determining the interactions
 CC between HCV envelope E2 protein and cellular protein in the presence and
 CC absence of the compound; and comparing the interaction to identify a
 CC compound which can inhibit the attachment of HCV onto cells.

XX Immuno-reactive hepatitis C virus polypeptide compsns. - contg.
 at least 2 sequences from the first variable domain of distinct
 PT HCV isolates

XX Disclosure; Fig 3; 106pp; English.

XX The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAQ39134-48
 CC and AAR33982-91.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TELEX: n/a

INFORMATION FOR SEQ ID NO: 6:

SEQUENCE CHARACTERISTICS:

LENGTH: 3011 amino acids

TYPE: amino acid

STRANDEDNESS: single

TOPOLOGY: linear

MOLECULE TYPE: peptide

FEATURE:

NAME/KEY: Duplication

LOCATION: 9

OTHER INFORMATION: /note= "There exists a

heterogeneity at this position - Xaa = Lys or Arg"

FEATURE:

NAME/KEY: Duplication

LOCATION: 11

OTHER INFORMATION: /note= "There exists a

heterogeneity at this position - Xaa = Asn or Thr"

FEATURE:

NAME/KEY: Duplication

LOCATION: 176

OTHER INFORMATION: /note= "There exists a

heterogeneity at this position - Xaa = Ile or Thr"

FEATURE:

NAME/KEY: Duplication

LOCATION: 334

OTHER INFORMATION: /note= "There exists a

heterogeneity at this position - Xaa = Met or Val"

FEATURE:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC {RNA}(N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
CC PROTEIN C AND MRNA.
CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

RT "Hepatitis C virus NS3 RNA helicase domain with a bound
RT oligonucleotide: the crystal structure provides insights into the mode
RL of unwinding.";
Structure 6:99-100(1998).
CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
CC ACTIVATION OF NS3.
CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC [RNA] (N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1
CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

RT "The Taiwanese hepatitis C virus genome: sequence determination and

mapping the 5' termini of viral genomic and antigenomic RNA.";

Virology 188:102-113(1992).

-|- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

-|- NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-|- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polypeptide, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-|- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA) (N).

-|- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND RNA.

-|- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

RA Schwegel T., Folander K., Swanson R.;
RL Submitted (JAN-1996) to the EMBL/GenBank/DBJ databases.
CC -!- FUNCTION: Mediates the voltage-dependent potassium ion
CC permeability of excitable membranes. Assuming opened or closed
CC conformations in response to the voltage difference across the
CC membrane, the protein forms a potassium-selective channel through
CC which K(+) ions may pass in accordance with their electrochemical
CC gradient (By similarity).
CC -!- SUBUNIT: Heterotrimer of potassium channel proteins (Probable).
CC -!- SUBCELLULAR LOCATION: Integral membrane protein.
CC -!- DOMAIN: The amino terminus may be important in determining the
CC rate of inactivation of the channel while the tail may play a role
CC in modulation of channel activity and/or targeting of the channel
CC to specific subcellular compartments.
CC -!- DOMAIN: The segment S4 is probably the voltage-sensor and is
CC characterized by a series of positively charged amino acids at
CC every third position.
CC -!- SIMILARITY: Belongs to the potassium channel family. A (Shaker)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DR Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope
XX proteins - in presence of disulphide bond cleavage agent, to
PT produce proteins suitable for direct use in vaccines or diagnostic
PT assays of HCV
XX Example 7; Page 67; 146pp; English.
PS AAR90965-R30980 and AAR90995-R31015 represent synthetic hepatitis C
XX virus (HCV) E1 and E2 peptides used in competition studies. This
CC sequence represents a synthetic E2 peptide, and corresponds to residues
CC 475-494 of the E2 protein sequence. These sequences are useful for in
CC vitro monitoring of HCV disease, or prognosis of the response to
CC interferon treatment of patients suffering from HCV infection. These
CC sequences compete with the proteins produced by AAT12704-T12709 and
CC AAT12961-T12974, which are included in vectors for the production of
CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be
CC isolated and purified by carrying out a disulphide bond cleavage, or a
CC reduction step with a disulphide bond cleavage agent, after lysis of
CC recombinant host cells. The constructs containing the purified HCV
CC envelope proteins can be used for vaccinating humans against HCV, for in
CC vitro detection of HCV antibodies in a sample, and in a serotyping assay
CC for detecting one or more serological types of HCV present in a
CC biological sample. The constructs can also be immobilised on a solid
CC substrate and incorporated into a reversed phase hybridisation assay for
CC determining the presence or the genotype of HCV. The new purification

```

```

CC method preserves the conformation of the recombinantly expressed E1, E2
CC and E1/E2, and eliminates contaminating proteins. Antigens isolated
CC using this method are more reactive with human sera than those isolated
CC by known techniques.

DR New therapeutic vaccine compositions comprising at least one purified
XX recombinant hepatitis C virus (HCV) single or specific oligomeric
PT recombinant envelope protein E1 or E2, useful for immunizing humans
PT from HCV infection
XX Example 7; Page 227; 243pp; English.
PS The present invention relates to new therapeutic vaccine compositions for
XX inducing hepatitis C virus (HCV)-specific antibodies, comprising a
CC composition containing at least one purified recombinant HCV single or
CC specific oligomeric recombinant envelope proteins selected from an E1 and
CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are
CC useful for inducing HCV-specific antibodies or for immunising humans
CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as
CC vaccine or therapeutics, in HCV screening and confirmatory antibody
CC tests, for raising antibodies, in the preparation of medicament, and for
CC in vitro monitoring of HCV disease or prognosing the response to
CC treatment of patients suffering from HCV infection. The present sequence
CC is a peptide derived from the proteins of the invention.

XX

This peptide is one of 19 specifically claimed antigens based on the immunoreactive regions of the envelope protein and non-structural proteins NS-1, NS-2, NS-3 and NS-5 for the Hepatitis C virus. The invention also concerns analogues, segments, mixtures, conjugates and polymers of these peptides. The C-terminal amino acid may be amidated. See also AAR20752-R20782.

XX Novel composition comprising a hepatitis C virus antisense
PT polynucleotide which is complementary to or corresponds to a sense
PT strand of the virus genome, and selectively hybridises to it -
XX
XX Example; Fig 4; 75pp; English.

The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense polynucleotide. The HCV is characterized by a positive stranded RNA genome which has 40% homology at the polypeptide level to a HCV polypeptide. The antisense polynucleotide binds to cellular polynucleotides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the course of the invention.

XX Immuno-reactive hepatitis C virus polypeptide compsns. - contg.
PT at least 2 sequences from the first variable domain of distinct
PT HCV isolates
XX
XX Disclosure; Fig 3; 106pp; English.
XX
XX The sequences given in AAR33992-002 represent a portion of the E2/NS1
CC protein encoded by group I and group II HCV isolates, from amino acid
CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
CC 30 amino acids which shows large variation between nearly all isolates.
CC This is an important immunoreactive domain. This putative envelope
CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
CC flaviviruses, both of which confer protective immunity in hosts
CC vaccinated with these polypeptides. It has been discovered that a
CC number of important HCV epitopes vary among viral isolates and that
CC these epitopes can be mapped to specific domains. This meant that
CC immunologically cross-reactive polypeptides which focus on variable
CC rather than constant domains can be produced. See also AAR39134-48

XX PT Treating or preventing hepatitis C virus infection in a subject,
XX PT involves administering hepatitis C virus envelope protein E2 binding
XX PT agents -

XX PS Claim 5; Fig 8; 46pp; English.

XX CC The present sequence represents a water soluble variant of a Hepatitis C
XX CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
XX CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
XX CC cells (especially liver cells), are used to treat HCV infections in
XX CC mammals, in particular humans. The specification also describes a method
XX CC for identifying a compound which can be used for treating or preventing
XX CC HCV in a subject and which can inhibit the attachment of HCV onto cells
XX CC by inhibiting the binding of HCV envelope E2 protein to a cellular
XX CC protein associated with HCV attachment and entry into cells. The method
XX CC comprises incubating the compound, HCV envelope E2 protein or its variant
XX CC and a cellular protein capable of specifically binding to the HCV E2
XX CC protein under suitable reaction conditions; determining the interactions
XX CC between HCV envelope E2 protein and cellular protein in the presence and
XX CC absence of the compound; and comparing the interaction to identify a
XX CC compound which can inhibit the attachment of HCV onto cells.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 RA Machida A., Miyakawa Y., Mayumi M.;
 RT "Nucleotide sequence of the genomic RNA of hepatitis C virus isolated
 RT from a human carrier; comparison with reported isolates for conserved
 RT and divergent regions.";
 RL J. Gen. Virol. 72:2697-2704 (1991).
 CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
 CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
 CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Glu in P1'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
 CC PROTEIN M AND MRNA.
 CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

RP SEQUENCE FROM N.A.
RX MEDLINE=92230232; PubMed=1314459;
RA Okamoto H., Kura K., Okada S.-I., Yamamoto K., Lizuka H., Tanaka T.,
RA Fukuda S., Teuda F., Mishiro S.;
RT "Full-length sequence of a hepatitis C virus genome having poor
RT homology to reported isolates: comparative study of four distinct
RT genotypes."
RL Virology 188:331-341(1992).
CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC (RNA) (N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
CC PROTEIN C AND MRNA.
CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

XX
XX Example 7; Page 67; 146pp; English.
XX
CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C
CC virus (HCV) E1 and E2 peptides used in competition studies. This
CC sequence represents a synthetic E2 peptide, and corresponds to residues
CC 487-506 of the E2 protein sequence. These sequences are useful for in
CC vitro monitoring of HCV disease, or prognosis of the response to
CC interferon treatment of patients suffering from HCV infection. These
CC sequences compete with the proteins produced by AAT12704-T12709 and
CC AAT12961-T12974, which are included in vectors for the production of
CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be
CC isolated and purified by carrying out a disulphide bond cleavage, or a
CC reduction step with a disulphide bond cleavage agent, after lysis of
CC recombinant host cells. The constructs containing the purified HCV
CC envelope proteins can be used for vaccinating humans against HCV, for in
CC vitro detection of HCV antibodies in a sample, and in a serotyping assay
CC for detecting one or more serological types of HCV present in a
CC biological sample. The constructs can also be immobilised on a solid
CC substrate and incorporated into a reversed phase hybridisation assay for
CC determining the presence or the genotype of HCV. The new purification
method preserves the conformation of the recombinantly expressed E1, E2
and E1/E2, and eliminates contaminating proteins. Antigens isolated
using this method are more reactive with human sera than those isolated
by known techniques.

PT recombinant envelope protein E1 or E2, useful for immunizing humans
XX from HCV infection
XX
XX Example 7; Page 227; 243pp; English.
XX
CC The present invention relates to new therapeutic vaccine compositions for
CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a
CC composition containing at least one purified recombinant HCV single or
CC specific oligomeric recombinant envelope proteins selected from an E1 and
CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are
CC useful for inducing HCV-specific antibodies or for immunising humans
CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as
CC vaccines or therapeutics, in HCV screening and confirmatory antibody
CC tests, for raising antibodies, in the preparation of medicament, and for
CC in vitro monitoring of HCV disease or prognosing the response to
CC treatment of patients suffering from HCV infection. The present sequence
CC is a peptide derived from the proteins of the invention.

XX New synthetic polypeptides having several different segments of at
PT least one parent polypeptide linked together differently compared to
PT the linkage in the parent polypeptide, for inducing immune response
PT against a pathogen or cancer.

XX Example 2; Fig 26; 364pp; English.

XX The invention relates to a new synthetic polypeptide (I) comprising
CC several different segments of at least one parent polypeptide linked
CC together in a different relationship relative to their linkage in the
CC parent polypeptide to impede, abrogate or otherwise alter at least one
CC function associated with the parent polypeptide and for inducing an
CC immune response against a pathogen or cancer. Also included are a
CC synthetic polynucleotide encoding and a computer system for
CC designing the synthetic polypeptides. The synthetic polypeptides and
CC polynucleotides are referred to as a vaccine. The synthetic polypeptide is
CC useful for modulating immune responses preferably directed against a
CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
CC Compositions comprising the polypeptide may be used in the treatment or
CC prophylaxis against viral (such as infections caused by HIV (human
CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
CC (e.g., infections caused by Neisseria, Meningococcus, Haemophilus,
CC Salmonella, Streptococcus, Legionella and Mycobacterium or parasitic
CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
CC Trypanosoma, Toxoplasma and Giardia) infections. The present
CC sequence is a peptide derived from a parent protein used to
CC construct a vaccine of the invention.

XX Structured antigenic peptide libraries contain some invariant amino

PT acids - accommodate variations in antigenic structure so are

PT effective against many different strains of e.g. rapidly mutating

XX viruses in vaccines

XX Claim 4; Page 91; 216pp; English.

CC In a structured synthetic antigen library, specific amino acids and
 CC their frequency of appearance at a variant locus within aligned
 CC peptide sequences are defined by the primary sequences of the several
 CC variants that make up the alignment used to construct the antigen
 CC peptide library. Branched SSALs representing the highly variable
 CC yet antigenic regions of the HCV Env and NS1 proteins are given in
 CC AAR74233-37 and were used as the key ingredients in a polyvalent
 CC vaccine for highly divergent global strains of HCV.

XX Novel composition comprising a hepatitis C virus antisense

PT polynucleotide which is complementary to or corresponds to a sense

PT strand of the virus genome, and selectively hybridises to it -

XX Example; Fig 4; 75pp; English.

XX The specification describes a pharmaceutical composition which

CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The

CC HCV is characterized by a positive stranded RNA genome which has

CC 40% homology at the polypeptide level to a HCV polyprotein. The

CC antisense polynucleotide binds to cellular polynucleotides which

CC enhance and/or are required for viral infectivity, replicative

CC ability or chronicity. The antisense polynucleotides may also be

CC designed to bind with high specificity, to be of increased stability,

CC to be stable and to have low toxicity. The composition also comprises

CC an agent which causes viral RNA to be inactive. The composition

CC is used for preventing HCV replication in a system. The present

CC sequence is encoded by a novel HCV cDNA sequence, which is used in the

CC course of the invention.

XX DR Immuno-reactive hepatitis C virus polypeptide compans. - contg.
PT at least 2 sequences from the first variable domain of distinct
PT HCV isolates
XX PS Disclosure; Fig 3; 106pp; English.
XX The sequences given in AAR33998-002 represent a portion of the E2/NS1
CC protein encoded by group I and group II HCV isolates, from amino acid
CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
CC 30 amino acids which shows large variation between nearly all isolates.
CC This is an important immunoreactive domain. This putative envelope
CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
CC flaviviruses, both of which confer protective immunity in hosts
CC vaccinated with these polypeptides. It has been discovered that a
CC number of important HCV epitopes vary among viral isolates and that
CC these epitopes can be mapped to specific domains. This meant that
CC immunologically cross-reactive polypeptides which focus on variable
CC rather than constant domains can be produced. See also AAR339134-48

XX PT involves administering hepatitis C virus envelope protein E2 binding
XX agents -
XX
XX PS Claim 3; Fig 7; 46pp; English.
XX
XX CC The present sequence represents a Hepatitis C virus (HCV) envelope
XX CC E2 protein. Agents that bind to the HCV E2 protein (such as the human
XX CC Eo protein), and so inhibit the attachment of HCV onto cells
XX CC (especially liver cells), are used to treat HCV infections in mammals,
XX CC in particular humans. The specification also describes a method for
XX CC identifying a compound which can be used for treating or preventing
XX CC HCV in a subject and which can inhibit the attachment of HCV onto cells
XX CC by inhibiting the binding of HCV envelope E2 protein to a cellular
XX CC protein associated with HCV attachment and entry into cells. The method
XX CC comprises incubating the compound, HCV envelope E2 protein or its variant
XX CC and a cellular protein capable of specifically binding to the HCV E2
XX CC protein under suitable reaction conditions; determining the interactions
XX CC between HCV envelope E2 protein and cellular protein in the presence and
XX CC absence of the compound; and comparing the interaction to identify a
XX CC compound which can inhibit the attachment of HCV onto cells.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:
ADDRESSEE: NIXON & VANDERHVE P.C.
STREET: 1100 NORTH GLEBE ROAD
CITY: ARLINGTON
STATE: VA
COUNTRY: USA
ZIP: 22201
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/10/044,995
FILING DATE: 15-Jan-2002
CLASSIFICATION: <Unknown>
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 08/391,671
FILING DATE: <Unknown>
APPLICATION NUMBER: US 07/920,286
FILING DATE: 14-OCT-1992
APPLICATION NUMBER: WO PCT/EP91/02409
FILING DATE: 13-DEC-1991
APPLICATION NUMBER: EP 90124241.2
FILING DATE: 14-DEC-1990
ATTORNEY/AGENT INFORMATION:
NAME: SADOFF, B.J.
REGISTRATION NUMBER: 36,663
REFERENCE/DOCKET NUMBER: 1487-5
TELEPHONE: 7038164000
TELEFAX: 7038164100
INFORMATION FOR SEQ ID NO: 23:
SEQUENCE CHARACTERISTICS:
LENGTH: 2894 amino acids
TYPE: amino acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: peptide
HYPOTHETICAL: NO
ANTI-SENSE: NO
SEQUENCE DESCRIPTION: SEQ ID NO: 23:
US-10-044-995-23
Query Match 100.0%; Score 20; DB 15; Length 2894;
Best Local Similarity 100.0%; Pred. No. 3.3e-12;
Matches 20; Conservative 0; Mismatches 0; Indels 0; Gaps 0;
QY 1 WHYPPKCGIVPAKSVCGPV 20
DB 487 WHYPPKCGIVPAKSVCGPV 506
RESULT 12
US-09-916-359-2
Sequence 2, Application US/09916359
Patent No. US20020034734A1
GENERAL INFORMATION:
APPLICANT: Veronique Barban
TITLE OF INVENTION: VACCINE COMPOSITION FOR PREVENTING OR
TREATING C HEPATITIS
FILE REFERENCE: PMC97-03A
CURRENT APPLICATION NUMBER: US/09/916,359
CURRENT FILING DATE: 2001-07-26
PRIOR APPLICATION NUMBER: 09/388,874
PRIOR FILING DATE: 1999-09-02
PRIOR APPLICATION NUMBER: 97/02,887
PRIOR FILING DATE: 1997-03-06
NUMBER OF SEQ ID NOS: 2
SOFTWARE: FastSeq for Windows Version 3.0
SEQ ID NO 2
LENGTH: 3011
TYPE: PPT
ORGANISM: Virus
US-09-916-359-2
Query Match 100.0%; Score 20; DB 9; Length 3011;
Best Local Similarity 100.0%; Pred. No. 3.4e-12;
Matches 20; Conservative 0; Mismatches 0; Indels 0; Gaps 0;

Pred. No. is the number of: results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
 CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
 CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
 CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
 CC ACTIVATION OF NS3.
 CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
 CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
 CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position. Cys or Thr in P1 and Ser or Ala in P1'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS; E1
 CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MENA.
 CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
 CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
 CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
 CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Hepatitis C virus immunogenic polypeptide contg. a T-cell

PT stimulating epitope - from core, E1, E2 and NS3 regions, useful in

PT production of vaccines, therapeutic agents, etc.

XX Example 4; Page 51; 105pp; English.

PS A series of overlapping peptides (including the present sequence) was

CC synthesised based on sequences in the core, E1 and E2/NS1 regions of

CC hepatitis C virus. The peptides were used as antigens in lympho-

CC proliferative assays to identify the main T-cell epitopes.

XX PT proteins - in presence of disulphide bond cleavage agent, to

PT produce proteins suitable for direct use in vaccines or diagnostic

PT assays of HCV

XX Example 7; Page 67; 146pp; English.

PS AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

XX virus (HCV) E1 and E2 peptides used in competition studies. This

CC sequence represents a synthetic E2 peptide, and corresponds to residues

CC 499-518 of the E2 protein sequence. These sequences are useful for in

CC vitro monitoring of HCV disease, or prognosis of the response to

CC interferon treatment of patients suffering from HCV infection. These

CC sequences compete with the proteins produced by AAT12704-T12709 and

CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

CC isolated and purified by carrying out a disulphide bond cleavage, or a

CC reduction step with a disulphide bond cleavage agent, after lysis of

CC recombinant host cells. The constructs containing the purified HCV

CC envelope proteins can be used for vaccinating humans against HCV, for in

CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

CC for detecting one or more serological types of HCV present in a

CC biological sample. The constructs can also be immobilised on a solid

CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

method preserves the conformation of the recombinantly expressed E1, E2

and E1/E2, and eliminates contaminating proteins. Antigens isolated

using this method are more reactive with human sera than those isolated

by known techniques.

XX PT New therapeutic vaccine compositions comprising at least one purified

PT recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans

XX from HCV infection

PS Example 7; Page 228; 243pp; English.

XX The present invention relates to new therapeutic vaccine compositions for

XX inducing hepatitis C virus (HCV)-specific antibodies, comprising a

CC composition containing at least one purified recombinant HCV single or

CC specific oligomeric recombinant envelope proteins selected from an E1 and

CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

CC useful for inducing HCV-specific antibodies or for immunising humans

CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

CC vaccines or therapeutics, in HCV screening and confirmatory antibody

CC tests, for raising antibodies, in the preparation of medicament, and for

CC in vitro monitoring of HCV disease or prognosing the response to

CC treatment of patients suffering from HCV infection. The present sequence

CC is a peptide derived from the proteins of the invention.

XX
XX Claim 26; SEQ ID 82; 61pp + sequence listing; English.
PS
XX The invention relates to nucleic acids encoding polypeptides which are
CC termed SID polypeptides (selected interacting domain). These polypeptides
CC are the final products of a double selection method involving a first
CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
CC through a two-hybrid system, and a second selection step involving an
CC alignment between the different polynucleotides selected at the first
CC step. The activity of polypeptides of the invention may be described as,
CC virucide, hepatotropic, antiinflammatory and antibacterial. The
CC polypeptide, polynucleotide and compositions comprising them are useful
CC for treating or preventing viral or a bacterial infection, specifically
CC infections or pathologies caused by HCV, or those pathologies linked to
CC HCV infection. These may include liver disease and liver cancer. The
CC current sequence represents a HCV bait polypeptide.
CC Note: The sequence data for this patent is not represented in the
CC specification, but is based on sequence information supplied by the
CC European Patent Office.

 DR
 XX New immunogenic polypeptide comprising hepatitis C virus E2 polypeptide
 PT useful for treating hepatitis C virus infection and for providing
 PT immune protection against virus infection
 XX

PS Claim 4; Fig 6; 84pp; English.
 XX
 XX The invention relates to a secreted polypeptide comprising hepatitis C
 CC virus (HCV) E2 polypeptide lacking all or a portion of its membrane
 CC spanning domain so that the E2 polypeptide is capable of secretion into
 CC growth medium when expressed recombinantly in a host cell. The
 CC polypeptide may also lack a portion of its C-terminus. The HCV E2
 CC secreted polypeptide is useful for producing anti-HCV antibodies. A
 CC purified immunogenic polypeptide comprising HCV E2 is useful for treating
 CC HCV infection and for providing immune protection against HCV infection
 CC by administering it to a subject having or at risk of having HCV
 CC infection or in need of protection. The method further comprises
 CC administering an immunomodulatory agent such as interleukin-2 (IL-2),
 CC granulocyte macrophage-colony stimulating factor (GM-CSF) or
 CC gamma-interferon. The polypeptide is useful as a vaccine, and with other
 CC HCV proteins to form a multi-component HCV vaccine for prophylactic or
 CC therapeutic treatment of HCV infection. This sequence represents an N-
 CC and C-terminally truncated HCV delta-delta E2 genotype 1a protein.

 DR
 XX Treating or preventing hepatitis C virus infection in a subject,
 PT involves administering hepatitis C virus envelope protein E2 binding
 PT agents
 XX
 XX Claim 5; Fig 8; 46pp; English.
 PS
 XX The present sequence represents a water soluble variant of a Hepatitis C
 CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
 CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
 CC cells (especially liver cells), are used to treat HCV infections in
 CC mammals, in particular humans. The specification also describes a method
 CC for identifying a compound which can be used for treating or preventing
 CC HCV in a subject and which can inhibit the attachment of HCV onto cells

CC by inhibiting the binding of HCV envelope E2 protein to a cellular
 CC protein associated with HCV attachment and entry into cells. The method
 CC comprises incubating the compound, HCV envelope E2 protein or its variant
 CC and a cellular protein capable of specifically binding to the HCV E2
 CC protein under suitable reaction conditions; determining the interactions
 CC between HCV envelope E2 protein and cellular protein in the presence and
 CC absence of the compound; and comparing the interaction to identify a
 CC compound which can inhibit the attachment of HCV onto cells.

PT Immuno-reactive hepatitis C virus polypeptide compens. - contg.
 PT at least 2 sequences from the first variable domain of distinct
 PT HCV isolates

PS Disclosure; Fig 3; 106pp; English.

XX The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera

CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAQ39134-48
 CC and AAR33982-91.

PT New expression system for proteins, partic. HCV antigens - for use
 PT in assays for screening and prognostic applications and for use in
 PT vaccines

XX Example 1; Page 29-30; 40pp; English.

XX This sequence comprises the conceptual translation product of
 CC a hepatitis C virus E2 antigen expression cassette (AAT13899). The
 CC encoded E2 antigen is truncated at amino acid residue 644 of HCV,
 CC and contains an N-terminal sequence (SNEI) from human prourokinase

CC intended to promote signal protease processing, efficient secretion
 CC and final product stability. Glycosylated E2 can be expressed in
 CC mammalian host cells utilizing claimed plasmid 577. Fusion
 CC proteins produced by plasmid 577 are used in claimed assays and
 CC test kits for detecting anti-analyte antibody as well as in claimed
 CC vaccines for treatment of infection. The plasmid can be used to
 CC produce high levels of proteins that would not normally be
 CC expressed in mammalian cells due to the non-secretory nature of the
 CC gene. The system is esp. used for expressing HCV proteins, allowing
 CC proper processing, glycosylation and conformation of the viral
 CC protein.

DE HGH-HCV-E2 fusion protein expressed by pHCV-170.

KW Hepatitis C Virus; Non-A, non-B hepatitis Virus; HCV; NANBHV;
 KW human growth hormone; HGH; secretion signal; fusion protein;
 KW vaccine.

OS Chimeric Hepatitis C Virus.
 OS Chimeric Homo sapiens.

FT Key Location/Qualifiers
 FT Region 1..32
 FT /note= "HGH secretion signal"
 FT Region 33..333
 FT /note= "HCV-E2 (amino acids 384-684)"

 PI Yamaguchi J, Zeck BJ;

XX WPI; 1993-258673/32.
 DR N-PSDB; AAQ47195.

XX New plasmid pHCV-162 is a mammalian expression systems for HCV
 PT proteins - useful for diagnosing HCV infection and as vaccines
 PT for preventing HCV infection

XX Claim 10; Page 81-82; 100pp; English.

XX A sequence coding for the HCV E2 protein (amino acids 384-684 from
 CC HCV-infected chimpanzee CO isolate, see AAR40119) was generated using
 CC PCR. An EcoRI site was used to attach a synthetic oligonucleotide
 CC encoding the Human Growth Hormone secretion signal at the 5'-end of

CC the HCV sequence. The resultant plasmid was designated pHCV-170.
 CC AAR40118 is the sequence of the HGH-HCV-E2 fusion protein expressed
 CC by vector pHCV-170. See AAQ47192-Q47196.
 CC (Updated on 25-MAR-2003 to correct PN field.)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC (RNA)(N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPID-PROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: OF
CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
CC PROTEIN C AND RNA.
CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
CC This SWISS-PROT entry is copyright. It is produced through a collaboration
CC between the Swiss Institute of Bioinformatics and the EMBL outstation -

 CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
 CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
 CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
 CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
 CC ACTIVATION OF NS3.
 CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
 CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
 CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position. Cys or Thr in Pi and Ser or Ala in Pi'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1
 CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
 CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY.
 CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
 CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
 CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

 RT "Full-length sequence of a hepatitis C virus genome having poor
 RT homology to reported isolates: comparative study of four distinct
 RT genotypes".
 RL Virology 188:331-341(1992).
 CC -1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
 CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
 CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
 CC -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Ala in P1'.
 CC -1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
 CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
 CC PROTEIN C AND MRNA.
 CC -1- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY 629.

PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope
PT proteins - in presence of disulphide bond cleavage agent, to
PT produce proteins suitable for direct use in vaccines or diagnostic
PT assays of HCV
XX
XX Example 7; Page 67; 146pp; English.
XX
CC AAR90965-R30980 and AAR90995-R31015 represent synthetic hepatitis C
CC virus (HCV) E1 and E2 peptides used in competition studies. This
CC sequence represents a synthetic E2 peptide, and corresponds to residues
CC 511-530 of the E2 protein sequence. These sequences are useful for in
CC vitro monitoring of HCV disease, or prognosis of the response to
CC interferon treatment of patients suffering from HCV infection. These
CC sequences compete with the proteins produced by AAT12704-T12709 and
CC AAT12963-T12974, which are included in vectors for the production of
CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be
CC isolated and purified by carrying out a disulphide bond cleavage, or a
CC reduction step with a disulphide bond cleavage agent, after lysis of
CC recombinant host cells. The constructs containing the purified HCV
CC envelope proteins can be used for vaccinating humans against HCV, for in
CC vitro detection of HCV antibodies in a sample, and in a serotyping assay
CC for detecting one or more serological types of HCV present in a
CC biological sample. The constructs can also be immobilised on a solid
CC substrate and incorporated into a reversed phase hybridisation assay for
CC determining the presence or the genotype of HCV. The new purification
```

```
CC method preserves the conformation of the recombinantly expressed E1, E2
CC and E1/E2, and eliminates contaminating proteins. Antigens isolated
CC using this method are more reactive with human sera than those isolated
CC by known techniques.

PT New therapeutic vaccine compositions comprising at least one purified
PT recombinant hepatitis C virus (HCV) single or specific oligomeric
PT recombinant envelope protein E1 or E2, useful for immunizing humans
PT from HCV infection.
XX
PS Example 7; Page 228; 243pp; English.
XX
XX The present invention relates to new therapeutic vaccine compositions for
XX inducing hepatitis C virus (HCV)-specific antibodies, comprising a
XX composition containing at least one purified recombinant HCV single or
XX specific oligomeric recombinant envelope proteins selected from an E1 and
XX an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are
XX useful for inducing HCV-specific antibodies or for immunising humans
XX against HCV. The recombinant HCV E1 and/or E2 proteins are useful as
XX vaccines or therapeutics, in HCV screening and confirmatory antibody
XX tests, for raising antibodies, in the preparation of medicament, and for
XX in vitro monitoring of HCV disease or prognosing the response to
XX treatment of patients suffering from HCV infection. The present sequence
XX is a peptide derived from the proteins of the invention.

XX
XX  New selected interacting domain polypeptides and polynucleotides,
PT  useful for treating or preventing infections or pathologies caused by
PT  hepatitis C virus (HCV) or those linked to HCV infection -
XX
XX  Claim 7; SEQ ID 6; 61pp + sequence listing; English.
XX
XX  The invention relates to nucleic acids encoding polypeptides which are
CC  termed SID polypeptides (selected interacting domain). These polypeptides
CC  are the final products of a double selection method involving a first
CC  step of selection of Hepatitis C virus (HCV)-derived polynucleotides
CC  through a two-hybrid system, and a second selection step involving an
CC  alignment between the different polynucleotides selected at the first
CC  step. The activity of polypeptides of the invention may be described as,
CC  virucide, hepatotropic, antiinflammatory and antibacterial. The
CC  polypeptide, polynucleotide and compositions comprising them are useful
CC  for treating or preventing viral or a bacterial infection, specifically
CC  infections or pathologies caused by HCV, or those pathologies linked to
CC  HCV infection. These may include liver disease and liver cancer. The
CC  current sequence represents a selected interacting domain (SID)
CC  polypeptide.
CC  Note: The sequence data for this patent is not represented in the
CC  specification, but is based on sequence information supplied by the
CC  European Patent Office.

XX
XX  New synthetic polypeptides having several different segments of at
PT  least one parent polypeptide linked together differently compared to
PT  the linkage in the parent polypeptide, for inducing immune response
PT  against a pathogen or cancer -
XX
XX  Example 2; Fig 26; 364pp; English.
XX
XX  The invention relates to a new synthetic polypeptide (I) comprising
CC  several different segments of at least one parent polypeptide linked
CC  together in a different relationship relative to their linkage in the
CC  parent polypeptide to impede, abrogate or otherwise alter at least one
CC  function associated with the parent polypeptide and for inducing an
CC  immune response against a pathogen or cancer. Also included are a
CC  synthetic polynucleotide encoding and a computer system for
CC  designing the synthetic polypeptides. The synthetic polypeptides and
CC  polynucleotides are referred to as a Savine. The synthetic polypeptide is
CC  useful for modulating immune responses preferably directed against a
CC  pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
CC  colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
CC  liver, oesophagus, brain, testicle, uterus), as potentiating agents.
CC  Compositions comprising the polypeptide may be used in the treatment or
CC  prophylaxis against viral (such as infections caused by HIV (human
CC  immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
CC  virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
CC  (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
CC  salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
CC  (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
CC  Trypanosoma, Toxoplasma and Giardia) infections. The present
CC  sequence is a peptide derived from a parent protein used to
CC  construct a savine of the invention.

XX
CC The invention relates to nucleic acids encoding polypeptides which are
CC termed SID polypeptides (selected interacting domain). These polypeptides
CC are the final products of a double selection method involving a first
CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
CC through a two-hybrid system, and a second selection step involving an
CC alignment between the different polynucleotides selected at the first
CC step. The activity of polypeptides of the invention may be described as,
CC virucide, hepatotropic, antiinflammatory and antibacterial. The
CC polypeptide, polynucleotide and compositions comprising them are useful
CC for treating or preventing viral or a bacterial infection, specifically
CC infections or pathologies caused by HCV, or those pathologies linked to
CC HCV infection. These may include liver disease and liver cancer. The
CC current sequence represents a selected interacting domain (SID)
CC polypeptide.
CC Note: The sequence data for this patent is not represented in the
CC specification, but is based on sequence information supplied by the

XX Novel composition comprising a hepatitis C virus antisense
 PT polynucleotide which is complementary to or corresponds to a sense
 PT strand of the virus genome, and selectively hybridises to it -

XX Example; Fig 5; 75pp; English.

XX The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
 CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polypeptide. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

 PT New immunogenic polypeptide comprising hepatitis C virus E2 polypeptide
 PT useful for treating hepatitis C virus infection and for providing
 PT immune protection against virus infection -
 XX
 PS Claim 4; Fig 6; 84pp; English.
 XX
 CC The invention relates to a secreted polypeptide comprising hepatitis C
 CC virus (HCV) E2 polypeptide lacking all or a portion of its membrane
 CC spanning domain so that the E2 polypeptide is capable of secretion into
 CC growth medium when expressed recombinantly in a host cell. The
 CC polypeptide may also lack a portion of its C-terminus. The HCV E2
 CC secreted polypeptide is useful for producing anti-HCV antibodies. A
 CC purified immunogenic polypeptide comprising HCV E2 is useful for treating
 CC HCV infection and for providing immune protection against HCV infection
 CC by administering it to a subject having or at risk of having HCV
 CC infection or in need of protection. The method further comprises
 CC administering an immunomodulatory agent such as interleukin-2 (IL-2),
 CC granulocyte macrophage-colony stimulating factor (GM-CSF) or
 CC gamma-interferon. The polypeptide is useful as a vaccine, and with other
 CC HCV proteins to form a multi-component HCV vaccine for prophylactic or
 CC therapeutic treatment of HCV infection. This sequence represents an N-
 CC and C-terminally truncated HCV delta-delta E2 genotype 1a protein.

 XX
 CC The present invention describes the modified Hepatitis C virus (HCV) E2
 CC proteins designated E2 majority, E2 majority R9 and E2 majority w/o (see
 CC ABP96703 to ABP96705), which are encoded by the nucleotide sequences
 CC given in ACC44818 to ACC44820. The modified E2 proteins have hepatotropic
 CC activities, and can be used in vaccines and in gene therapy. The modified
 CC E2 protein and compositions comprising them can be used for the
 CC manufacture of an HCV vaccine composition, for inducing immunity against
 CC HCV chronic carriers prior to, simultaneously to or after any other
 CC therapy, or in HCV-infected individuals prior to or after liver
 CC transplantation, or after presumed infection, and for prophylactically
 CC inducing immunity against HCV.

PT Treating or preventing hepatitis C virus infection in a subject,
PT involves administering hepatitis C virus envelope protein E2 binding
PT agents -
XX
PS Claim 5; Fig 8; 46pp; English.
XX
CC The present sequence represents a water soluble variant of a Hepatitis C
CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
CC cells (especially liver cells), are used to treat HCV infections in
CC mammals, in particular humans. The specification also describes a method
CC for identifying a compound which can be used for treating or preventing
CC HCV in a subject and which can inhibit the attachment of HCV onto cells
CC by inhibiting the binding of HCV envelope E2 protein to a cellular
CC protein associated with HCV attachment and entry into cells. The method
CC comprises incubating the compound, HCV envelope E2 protein or its variant
CC and a cellular protein capable of specifically binding to the HCV E2
CC protein under suitable reaction conditions; determining the interactions
CC between HCV envelope E2 protein and cellular protein in the presence and
CC absence of the compound; and comparing the interaction to identify a
CC compound which can inhibit the attachment of HCV onto cells.
